Hypothesis tests may be performed on contingency tables in order to decide whether or not effects are present. Effects in a contingency table are defined as relationships between the row and column variables; that is, are the levels of the row variable differentially distributed over levels of the column variables. Significance in this hypothesis test means that interpretation of the cell frequencies is warranted.

Playing QB in the NFL is a complicated thing, which is one reason why the vast majority of the QBs who enter the league, or even start for a couple of years, ultimately flame out. Some simply never get good, some get perceived unfairly because they are on bad teams; you have different coordinators and schemes, injuries to mention the confidence factor, etc. There are a lot of variables.
